

2025 GUIDE TO COMMERCIAL AND INDUSTRIAL ELECTRIC TRANSPORTATION

JANUARY 2025

2025 GUIDE TO COMMERCIAL AND INDUSTRIAL ELECTRIC TRANSPORTATION

Vehicle Class Definitions	3
Electric Transit Buses	4
Electric School Buses	6
Electric Refuse Trucks	8
Electric Medium-Duty Vehicles	10
Electric Heavy-Duty Vehicles	12
Charging Primer	14
References	15

BEVs are electric vehicles in which the traditional combustion engine and transmission are replaced by batteries and electric motors. The battery size can vary just as fuel tank sizes can vary in combustion vehicles. BEVs rely on electricity as fuel, so they have no tailpipe emissions.

WHY ELECTRIC?

ELECTRIC TRANSPORTATION FOR BUSINESS

The Guide to Commercial and Industrial On-Road Electric Vehicles introduces the electric vehicles that are currently in use or can be used for commercial and industrial applications. Electricity currently moves materials, goods, and people through many means of transportation. The market for commercial and industrial electric vehicles and equipment continues to accelerate due to the continuous technology innovation and market synergies.

This guide is organized by commercial and industrial market segment and type of equipment.

ELECTRIC VEHICLE CHARACTERISTICS

This guide highlights battery-electric medium and heavy-duty vehicles that plug into the grid to charge their batteries.

VEHICLE CLASS DEFINITIONS

CLASS 1 – 6,000 lbs. or less

SEDAN PASSENGER VAN SUV COMPACT PICKUP

CLASS 2 – 6,001 lbs. to 10,000 lbs.

MID-SIZE PICKUP FULL-SIZE PICKUP CARGO VAN STEP VAN

CLASS 3 – 10,001 lbs. to 14,000 lbs.

WALK-IN VAN BOX TRUCK CITY DELIVERY HEAVY-DUTY PICKUP

CLASS 4 – 14,001 lbs. to 16,000 lbs.

LARGE WALK-IN SHUTTLE BUS UPFITTED TRUCK STEP VAN

CLASS 5 – 16,001 lbs. to 19,500 lbs.

BUCKET TRUCK DELIVERY TRUCK LARGE WALK-IN VAN OTHER UPFITTED TRUCK

CLASS 6 – 19,501 lbs. to 26,000 lbs.

TRANSIT BUS SCHOOL BUS STAKE BODY TRUCK OTHER UPFITTED TRUCK

CLASS 7 – 26,001 lbs. to 33,000 lbs.

TRANSIT BUS SCHOOL BUS TRUCK TRACTOR REFUSE TRUCK TANK TRUCK STREET SWEEPER DIGGER DERRICK

CLASS 8 – 33,001 lbs. and above

TRUCK TRACTOR SLEEPER CAB REFUSE TRUCK CEMENT TRUCK TANK TRUCK FIRE TRUCK

Gross Vehicle Weight Rating (lbs)	Federal Highway Administration		US Census Bureau
	Vehicle Class	GVWR Category	VIUS Classes
> 6,000	Class 1: < 6,000 lbs	Light Duty < 10,000 lbs	Light Duty < 10,000 lbs

ELECTRIC TRANSIT BUSES

APPLICATION

Transit buses are designed to carry large numbers of passengers on fixed scheduled routes as public transportation. Cities will have fleets of hundreds of transit buses.

TECHNOLOGY

Electric transit buses have become very popular in the cities. Currently, there are nearly 2,500 transit buses on the road across the nation. There are at least four manufacturers with 23 different models.

CHARGING CAPABILITIES

Most transit buses are charged with DC only (Level 2 AC is not used). BYD has used 3 phase power to their inverters as a charger. Automated charging is an option that is generally used. The automated charging uses a pantograph defined by SAE J3105-1. *See the charging section, p 14.*

ELECTRIC SCHOOL BUSES

APPLICATION

School buses typically begin their day by picking up students in the morning and delivering them to school. Afterward, they return to the bus yard between routes. In the afternoon, the buses are sent back out to transport students home, and later in the day, they return to the yard and are charged overnight, ready for the next day's routes. This makes school buses well-suited for electrification: since they only need to run specific routes, the amount of energy required is relatively low, and there's ample time for charging between routes. However, it's important to account for other activities, such as transporting students to after-school events like games across town, which can impact the charging schedule.

TECHNOLOGY

Electric school buses have become popular by school districts. Currently, there are nearly 1,600 school buses on the road across the nation. There are at least five manufacturers with 11 different models. *See the list.*

CHARGING CAPABILITIES

Most school buses are charged with Level 2 AC, but DC with CCS is also an option (85-150kW). Automated charging has not been attractive for school buses. Many people believe that V2G could be used on school buses using the DC charging interface. It has been shown that a higher power Level 2 AC EVSE is quite adequate for most applications since the school bus has an extended period to charge. Based on the state of the V2G market, this currently added significant costs and complexity with unclear benefits.

ELECTRIC REFUSE TRUCKS

APPLICATION

Refuse trucks, also known as “garbage trucks”, are used in the collection of waste in the sanitation industry. Hydraulics are used to compact as well as pick up trash cans and empty them in the truck. The waste is then transported to a dump or recycle center for processing.

TECHNOLOGY

Electric refuse trucks are becoming popular. The trucks are usually all Class 7 or 8. The Heil refuse trucks does not use hydraulics but rather use electric motors to do the compacting and picking up trash cans. It still uses the diesel engine to move the vehicle. *See the list.*

CHARGING CAPABILITIES

Most refuse trucks are charged with DC using the CCS connector at 150kW or more. Some trucks are equipped with Level 2 AC. The typical on-route speed is minimal (going from house to house). The hydraulics uses power from the battery at each house. Unloaded refuse trucks drive at higher speeds when either returning a load or picking up a new one. On a typical day, a fleet of refuse trucks can make 80 to 120 waste bin pickups. Larger battery packs will be required for extended operation.

ELECTRIC MEDIUM-DUTY VEHICLES

APPLICATION

Medium-duty trucks range from Class 3 to Class 6. The Class weights are shown on page 18. The Class 3 types are typically vans and heavier pickup trucks and SUVs. The other classes are either cab-on-chassis, or Box trucks. Box trucks are storage units that are assembled on a cab-on-chassis chassis. Delivery step vans are also included. Currently, there are more than 13,766 electric medium-duty trucks on the road made by 11 different manufacturers.

TECHNOLOGY

The electric medium-duty trucks are typically last mile vehicles with storage for delivery. The vehicles range from 120 to 400 miles on a charge. The Class 3 purchase price ranges from \$60K to \$100K. Class 4 and beyond range up to \$330K. *See the list sorted by class size and the manufacturer.*

CHARGING CAPABILITIES

Most medium-duty trucks are charged with DC with CCS up to almost 300 kW. Some trucks are equipped with Level 2 AC.

ELECTRIC HEAVY-DUTY VEHICLES

APPLICATION

Heavy-duty trucks range from Class 7 to 8. The class weights are shown on page 18. The heavy-duty classes include long haul tractors, cab-on-chassis chassis, and yard trucks. Currently, there are nearly 2,400 electric heavy-duty trucks on the road made by 8 different manufacturers.

TECHNOLOGY

The electric medium-duty trucks are typically last mile vehicles with storage for delivery. The vehicles range from 120 to 400 miles on a charge. The Class 3 purchase price ranges from \$60K to \$100K. Class 4 and beyond range up to \$330K.

CHARGING CAPABILITIES

Most heavy-duty trucks are charged with DC-CCS up to 400 kW. Only a few trucks are equipped with Level 2 AC. No special charging is available on heavy-duty trucks. The Daimler (Freightliner) eActros 600 and the Tesla Semi are planning on using the 1000 kW MCS (MegaWatt Charging).

*Top Speed 25 mph, operates up to 24 hours on a charge

**Pricing is difficult to attain. Most times it is given as HVIP pricing in California.

CHARGING PRIMER

SAE J1772

Both AC and DC charging are suitable for fueling electric vehicles. SAE J1772(TM) and J3400(TM) standards describe interfaces for both AC and DC charging. However, based on factors such as distance and charge time, one method could be better than another.

AC charging can be done at different voltage, with power levels up to 20 kW.

DC Fast charge uses DC at the connection at the same voltage as the battery on board.

AC charging has the charger located on the vehicle. Whereas the DC charger has the charger in the infrastructure.

AUTOMATED CONDUCTIVE CHARGING SAE J3105

Most transit buses are using a CCS1 charger (right) for manually charging. Automated charging is also being used both on the route and at the depot. At the depot, no manual work is required to charge the buses. The bus is parked under the pantograph, WiFi and RFID are used to communicate, and the pantograph comes down properly onto the conductive rails on the roof of the bus. Charging begins. It is all initiated by properly parking the bus under the pantograph and then setting the parking brake.

On-route charging tends to be higher power than in the depot. On-route the bus is only charged for a few minutes to accomplish the bus getting back on route. Whereas the depot charging is lower power since much more charge time is allowed.

MEGAWATT CHARGING SYSTEM (MCS)

The MCS is being defined by SAE J3271. This document describes the megawatt-level DC charging system requirements for couplers/inlets, cables, cooling, communication and interoperability. The intended application is for commercial vehicles with larger battery packs requiring higher charging rates for moderate dwell time. A simplified analog safety signaling approach is used for connection-detection to guarantee de-energized state for unmated couplers with superimposed high-speed data for EVSE-EV charging control and other value-added services.

NORTH AMERICAN CHARGE SYSTEM (NACS)

The NACS is being defined by SAE J3400. A document covering the general physical, electrical, functional, and performance requirements for conductive power transfer to an electric vehicle using a handheld conductive coupler capable of transferring either DC or single-phase power using two current-carrying contacts. The charging control protocol is derived from the original SAE J1772 connector and the Tesla NACS connector.
